- Leave to rise at 30 °C for 4,30 hours, or at least until it triples.

WARNING:

-It is advisable to make the "spy", putting 333 g of finished dough in a 1 liter jug to verify the effective triPLICATION.

-If the temperature of the first dough should be above 28 °C, it will be necessary to reduce the time of the first rising.

WARNINGS

How to Calculate the water temperature in the first dough:

This method is correct if you have a kneader with diving arms, if alternatively you have a spiral kneader, and keeping in mind that the same tends to heat the dough a lot, reduce the water temperature by at least 5 °C.

In order to obtain the correct final temperature of the dough, let's assume 26 to C, follow the diagram below.

It will be necessary to know and then measure 3 values:

- 1) the value of the ambient temperature
- 2) the temperature value of the Dolce Forno
- 3) the value defined in function of the mixer used (plunger 15, spiral or planetary mixer 20).

CALCULATION: Final Temperature 26 months C x 3 (fixed number) = 78 - value 1 (e.g. 20 years C) - value 2 (e.g. 18 years C) - value 3 (e.g. 15) = 78-20-18-15 = 25 which will be the temperature of the water in the first mixture using a dipper
